

WATER

If you notice **water flowing from the tap** in the kitchen or bathroom, **turn it off** right away. Someone must have forgotten to do it. It may also be the case of a damaged gasket. If you see water dripping, please **report the malfunction** to the building administrator.

When washing your hands, **do not turn on the tap on full power**. You will see that is not needed to wash them effectively.

Put dishes in the dishwasher. Do not wash them in the sink. Start the device only when it is full, select the eco mode.

The toilet flush usually has two options. Pressing one will pour more water, the other, half as much – use them as specifically as you need.

If there is water left in the glass or bottle and you do not plan on drinking it, do not pour it in the sink. **Water the flowers** instead.

At home

It is better to use a shower instead of taking a bath (a large two-person bathtub can hold 290L of water), but at the same time it is worth remembering a few rules so as not to use too much water and approach it more economically. **Lower the water temperature; cut the time** – ex. 5 minutes instead of 10 minutes in the cabin; **reduce the water flow; turn off the water while lathering.**

You can also purchase a **faucet aerator** which allows us to use less water both in the shower and in the sink, while keeping the washing process just as effective.

A large two-person bathtub can hold **290L** of water.
During a 10-minute shower you use **127L** of water.
